TravelTracker enables a property manager to automatically track their competitors' prices and react quickly and seamlessly with their own price structures. It does this by continually monitoring designated Internet travel sites, and compiling reports that are available at all times for review. Additionally, changes in the rates can be emailed to a designated block of 5 addresses according to your criteria. The interface is completely designed in HTML and therefore is available at any computer connected to the Internet in the world at all times,

without any special software.

Functionality

TravelTracker can monitor an unlimited number of properties on an unlimited number of data engines (i.e. Internet travel sites). The application consists of three components:

Reporting Screen : A secured portion of the site that allows a user to log in via a username and password. They then see a "dashboard" that allows them to view the different reports (i.e. 30, 60, 90 day) for the properties being monitored.

Engine Architecture: The data engines run within their own architecture. Their operation is transparent to the users and can be monitored via log entries and a dashboard in the system.

Maintenance

All maintenance will be done remotely once the initial installation is complete.

The yearly license includes maintenance of the data engines. MMI will update the data engines if a data source's format changes within 1 week of the change.
